We know sitting too much is bad, and most of us intuitively feel a little guilty after a long TV binge. But what exactly goes wrong in our bodies when we park ourselves for nearly eight hours per day, the average for a U.S. adult? Many things, say four experts, who detailed a chain of problems from head to toe.

**ORGAN DAMAGE**

**Heart disease**
Muscles burn less fat and blood flows more sluggishly during a long sit, allowing fatty acids to more easily clog the heart. Prolonged sitting has been linked to high blood pressure and elevated cholesterol, and people with the most sedentary time are more than twice as likely to have cardiovascular disease than those with the least.

**Overproductive pancreas**
The pancreas produces insulin, a hormone that carries glucose to cells for energy. When you sit for a long time, disks are squashed unevenly and lose sponginess. Collagen hardens around supporting tendons and ligaments.

**Colon cancer**
Studies have linked sitting to a greater risk for colon, breast and endometrial cancers. The reason is unclear, but one theory is that excess insulin encourages cell growth. Another is that regular movement boosts natural antioxidants that kill cell-damaging — and potentially cancer-causing — free radicals.

**MUSCLE DEGENERATION**

**Mushy abs**
When you stand, move or even sit up straight, abdominal muscles keep you upright. But when you slump in a chair, they go unused. Tight back muscles and wimpy abs form a posture-wrecking alliance that can exaggerate the spine's natural arch, a condition called hyperlordosis, or swayback.

**Tight hips**
Flexible hips help keep you balanced, but chronic sitters so rarely extend the hip flexors in front that they become short and tight, limiting range of motion and stride length. Studies have found that decreased hip mobility is a major reason elderly people tend to fall.

**Limp glutes**
Sitting requires your glutes to do absolutely nothing, and they get used to it. Soft glutes hurt your stability, your ability to push off and your ability to maintain a powerful stride.

**LEG DISORDERS**

**Poor circulation in legs**
Sitting for long periods of time slows blood circulation, which causes fluid to pool in the legs. Problems range from swollen ankles and varicose veins to dangerous inactivity — it correctly. As Mom always said, “Sit up straight.”

**Soft bones**
Weight-bearing activities such as walking and running stimulate hip and lowerbody bones to grow thicker, denser and stronger. Scientists partially attribute the recent surge in cases of osteoporosis to lack of activity.

**So what can we do? The experts recommend . . .**

**Sitting on something wobbly such as an exercise ball or even a backless stool to force your core muscles to work, sit up straight and keep your feet flat on the floor in front of you so they support about a quarter of your weight.**

**Stretching the hip flexors for three minutes per side once a day, like this:**

**Alternating between sitting and standing at your work station, if you can’t do that, stand up every half hour or so and walk.**

**Trying yoga poses — the cow pose and the cat pose — to improve extension and flexion in your back.**

**ORGAN DAMAGE**

Heart disease
Muscles burn less fat and blood flows more sluggishly during a long sit, allowing fatty acids to more easily clog the heart. Prolonged sitting has been linked to high blood pressure and elevated cholesterol, and people with the most sedentary time are more than twice as likely to have cardiovascular disease than those with the least.

**Overproductive pancreas**
The pancreas produces insulin, a hormone that carries glucose to cells for energy. But cells in idle muscles don’t respond as readily to insulin, so the pancreas produces more and more, which can lead to diabetes and other diseases. A 2011 study found a decline in insulin response just one day of prolonged sitting.

**Colon cancer**
Studies have linked sitting to a greater risk for colon, breast and endometrial cancers. The reason is unclear, but one theory is that excess insulin encourages cell growth. Another is that regular movement boosts natural antioxidants that kill cell-damaging — and potentially cancer-causing — free radicals.

**TROUBLE AT THE TOP**

**Foggy brain**
Moving muscles pump fresh blood and oxygen through the brain and trigger the release of all sorts of brain- and mood-enhancing chemicals. When we are sedentary for a long time, everything slows, including brain function.

**Strained neck**
If most of your sitting occurs at a desk at work, cranking your neck forward toward a keyboard or lifting your head to cradle a phone while typing can strain the cervical vertebrae and lead to permanent imbalances.

**Sore shoulders and back**
The neck doesn’t slouch alone. Slumping forward overextends the shoulder and back muscles as well, particularly the trapezius, which connects the neck and shoulders.

**BAD BACK**

**Inflexible spine**
Spines that don’t move become inflexible and susceptible to damage in mundane activities, such as when you reach for a coffee cup or bend to tie a shoe. When we move around, soft disks between vertebrae expand and contract like sponges, soaking up fresh blood and nutrients. When we sit for a long time, disks are squashed unevenly and lose sponginess. Collagen hardens around supporting tendons and ligaments.

**Disk damage**
People who sit more are at greater risk for herniated lumbar disks. A muscle called the psoas travels through the abdominal cavity and, when it tightens, pulls the upper lumbar spine forward. Upper body weight rests entirely on the ischeal tuberosity (sitting bones) instead of being distributed along the arch of the spine.

**THE RIGHT WAY TO SIT**

If you have to sit often, try to do it correctly. As Mom always said, “Sit up straight.”

**The experts**

Scientists interviewed for this report:

James A. Levine, inventor of the treadmill desk and director of Obesety Solutions at Mayo Clinic and Arizona State University.

Charles E. Matthews, National Cancer Institute investigator and author of several studies on sedentary behavior.

Jay Dicharry, director of the NPR Biomechanics Lab in Bend, Ore., and author of “Anatomy for Runners.”

Tal Amosay, biomechanist at Barry University’s Department of Sport and Exercise Sciences.
